## Features of the Cross-Roller Table

Fig.1 Structure of the Cross-Roller Table

### Structure and Features

The Cross-Roller Table is a compact, highly rigid finite linear guide unit that has the Cross-Roller Guide(s) between the precision-machined table and base.

There are two types of the Cross-Roller Table: model VRU, and a miniature type model VRT. The Cross-Roller Table is used in extensive applications such as OA equipment and peripherals, measuring instruments and printed circuit board drilling machines.

## Features

### Features of the Cross-Roller Table

#### [Easy Installation]

Since the Cross-Roller Guide(s) is installed between the precision-machined table and base, a highly accurate linear guide mechanism is achieved simply by mounting the product with bolts.

#### [Large Permissible Load]

Since rollers with large rated loads are installed in short pitches, the cross-roller guide is capable of bearing a heavy load, achieving a highly rigid linear guide mechanism and gaining a long service life.

#### [Diversified Usage]

Since the rollers are orthogonally arranged one after another, the guide system is capable of evenly receiving loads in the four directions applied on the table. (See Fig.2.)

Fig.2 Load Directions

Model VRT

Model VRT-A

Model VRU

#### [Highly Corrosion Resistant]

The base and the table of models VRT-M and VRT-AM use stainless steel. Their rails, rollers, roller cages and screws are also made of stainless steel. As a result, these guide systems have significantly high corrosion resistance.

The base and the table of model VRU-M are made of aluminum.

## Rated Load and Nominal Life

### [Rated Loads in All Directions]

The rated loads of models VRT, VRT-A and VRU are equal in four directions (radial, reverse radial and lateral directions), and their values are expressed as C and C<sub>0</sub> in the corresponding specification tables.

### [Static Safety Factor f<sub>s</sub>]

The Cross-Roller Table may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{C_0}{P_c} \quad \text{or} \quad f_s = \frac{M_0}{M}$$

- f<sub>s</sub> : Static safety factor  
 C<sub>0</sub> : Basic static load rating (kN)  
 M<sub>0</sub> : Static permissible moment (M<sub>A</sub>, M<sub>B</sub> and M<sub>C</sub>)  
 P<sub>c</sub> : Calculated load (kN)  
 M : Calculated moment (kN)

### ● Reference value of static safety factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Values of Static Safety Factor (f<sub>s</sub>)

Machine using the LM system	Load conditions	Lower limit of f <sub>s</sub>
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3

**[Calculating the Nominal Life]**

The nominal life of the THK cross-roller table is defined as 100 km. The nominal life ( $L_{10}$ ) is calculated from the basic dynamic load rating ( $C$ ) and the load acting on the cross-roller table ( $P_c$ ) using the following formula.

$$L_{10} = \left( \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots\dots(1)$$

$L_{10}$	: Nominal life	(km)
$C$	: Basic dynamic load rating	(kN)
$P_c$	: Calculated radial load	(kN)

When comparing the nominal life ( $L_{10}$ ), you must take into account whether the basic dynamic load rating was defined based on 50 km or 100 km. Convert the basic dynamic load rating based on ISO 14728-1 as necessary.

ISO-regulated basic dynamic load rating conversion formula:

$$C_{100} = \frac{C_{50}}{1.23}$$

$C_{50}$	: Basic dynamic load rating based on a nominal life of 50 km
$C_{100}$	: Basic dynamic load rating based on a nominal life of 100 km

**[Calculating the Modified Nominal Life]**

During use, a cross-roller table may be subjected to vibrations and shocks as well as fluctuating loads, which are difficult to detect. In addition, the operating temperature will have a decisive impact on the service life. Taking these factors into account, the modified nominal life ( $L_{10m}$ ) can be calculated according to the following formula (2).

●Modified factor  $\alpha$

$$\alpha = \frac{f_r}{f_w}$$

$\alpha$	: Modified factor	
$f_r$	: Temperature factor	(see Fig.1 on <b>A8-6</b> )
$f_w$	: Load factor	(see Table 2 on <b>A8-6</b> )

●Modified nominal life  $L_{10m}$

$$L_{10m} = \left( \alpha \times \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots\dots(2)$$

$L_{10m}$	: Modified nominal life	(km)
$C$	: Basic dynamic load rating	(kN)
$P_c$	: Calculated radial load	(kN)

**[Calculating the Service Life Time]**

When the nominal life ( $L_{10}$ ) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following formula.

$$L_h = \frac{L_{10} \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

$L_h$	: Service life time	(h)
$\ell_s$	: Stroke length	(mm)
$n_1$	: Number of reciprocations per minute	(min <sup>-1</sup> )

● **f<sub>t</sub>: Temperature Factor**

If the temperature of the environment surrounding the operating model VRT, VRT-A or VRU exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.1.

Note) If the environment temperature exceeds 100°C, contact THK.

Fig.1 Temperature Factor (f<sub>t</sub>)

● **f<sub>w</sub>: Load Factor**

In general, reciprocating machines tend to experience vibrations or impacts during operation, and it is difficult to accurately determine the vibrations generated during high-speed operation and impacts during frequent starts and stops. Therefore, when the actual load applied to a Model VRT, VRT-A, or VRU cannot be obtained, or when speed and vibrations have a significant influence, divide the basic dynamic load rating (C) by the corresponding load factor in Table 2, which has been empirically obtained.

Table 2 Load Factor (f<sub>w</sub>)

Vibrations/ impact	Speed (V)	f <sub>w</sub>
Faint	Very low V ≤ 0.25m/s	1 to 1.2
Weak	Slow 0.25 < V ≤ 1m/s	1.2 to 1.5

Accuracy Standards

For Cross-Roller Table models VRT, VRT-A, and VRU, the dimensional tolerances in height (M) and width (W) and the running accuracy of surfaces C and D are indicated in the corresponding specification tables.

## Precautions on Use

## Cross-Roller Table

### [Handling]

- (1) Do not disassemble the parts. This will result in loss of functionality.
- (2) The cross-roller table is shipped with the clearance adjustment screws set to the optimal preload level. Do not overtighten or overloosen this screw, as excess preload or clearance can affect the function of the product.
- (3) Take care not to drop or strike the Cross-Roller Table. Doing so may cause injury or damage. Giving an impact to it could also cause damage to its function even if the product looks intact.
- (4) When handling the product, wear protective gloves, safety shoes, etc., as necessary to ensure safety.

### [Precautions on Use]

- (1) Prevent foreign material, such as cutting chips or coolant, from entering the product. Failure to do so may cause damage.
- (2) If foreign material such as cutting chips adheres to the product, replenish the lubricant after cleaning the product.
- (3) Do not use the product at temperature of 100°C or higher.
- (4) Do not use the internal stopper, a mechanism that prevents the table from being removed, as a stopper. This may damage the stopper due to impact.
- (5) Micro-strokes tend to obstruct oil film to form on the raceway in contact with the rolling element, and may lead to fretting corrosion. Take consideration using grease offering excellent fretting prevention. THK also recommends periodically executing a full stroke with the unit to ensure that the raceway and balls are coated with lubricant.
- (6) Do not use undue force when fitting parts (pin, key, etc.) to the product. This may generate permanent deformation on the raceway, leading to loss of functionality.
- (7) Insufficient rigidity or accuracy of mounting members causes the bearing load to concentrate on one point and the bearing performance will drop significantly. Accordingly, give sufficient consideration to the rigidity/accuracy of the housing and base and strength of the fixing bolts.

### [Lubrication]

- (1) For lubrication of the Cross-Roller Table, use lithium-soap group grease or oil when it is necessary as with ordinary bearings.
- (2) Thoroughly wipe off anti-rust oil and feed lubricant before using the product.
- (3) When lubricating the product, apply grease directly on the raceway and stroke the product several times to let the grease spread inside.
- (4) Do not mix different lubricants. Mixing greases using the same type of thickening agent may still cause adverse interaction between the two greases if they use different additives, etc.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, use the grease appropriate for the specification/environment.
- (6) The consistency of grease changes according to the temperature. Take note that the slide resistance of the Cross-Roller Table also changes as the consistency of grease changes.
- (7) After lubrication, the slide resistance of the Cross-Roller Table may increase due to the agitation resistance of grease. Be sure to perform a break-in to let the grease spread fully, before operating the machine.
- (8) Excess grease may scatter immediately after lubrication, so wipe off scattered grease as necessary.

**THK**
**A8-19**

**HENNlich s.r.o.**

Košťany nad Turcom 543, 038 41 Košťany nad Turcom

**Tel.:** 0940 644 565

**E-mail:** [liintech@hennlich.sk](mailto:liintech@hennlich.sk)
[www.hennlich.sk](http://www.hennlich.sk)

- (9) The properties of grease deteriorate and its lubrication performance drops over time, so grease must be checked and added properly according to the use frequency of the machine.
- (10) The greasing interval varies depending on the use condition and service environment. Set the final lubrication interval/amount based on the actual machine.

#### [Displacement of Cage]

The movements of the cage that holds the rollers are highly precise, but the cage can be displaced due to drive vibration, inertial force, or impact.

Please consult THK before using this product under any of the following conditions.

- In a vertical position
- With a pneumatic cylinder drive
- With a cam drive
- With a high-speed crank drive
- With a heavy moment load
- In a configuration where the external stopper butts up against the table

#### [Storage]

When storing the Cross-Roller Table, enclose it in a package designated by THK and store it in a room in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

#### [Disposal]

Dispose of the product properly as industrial waste.

## Features of the Cross-Roller Table

Fig.1 Structure of the Cross-Roller Table

### Structure and Features

The Cross-Roller Table is a compact, highly rigid finite linear guide unit that has the Cross-Roller Guide(s) between the precision-machined table and base.

There are two types of the Cross-Roller Table: model VRU, and a miniature type model VRT. The Cross-Roller Table is used in extensive applications such as OA equipment and peripherals, measuring instruments and printed circuit board drilling machines.

## Features

### Features of the Cross-Roller Table

#### [Easy Installation]

Since the Cross-Roller Guide(s) is installed between the precision-machined table and base, a highly accurate linear guide mechanism is achieved simply by mounting the product with bolts.

#### [Large Permissible Load]

Since rollers with large rated loads are installed in short pitches, the cross-roller guide is capable of bearing a heavy load, achieving a highly rigid linear guide mechanism and gaining a long service life.

#### [Diversified Usage]

Since the rollers are orthogonally arranged one after another, the guide system is capable of evenly receiving loads in the four directions applied on the table. (See Fig.2.)

Fig.2 Load Directions

Model VRT

Model VRT-A

Model VRU

#### [Highly Corrosion Resistant]

The base and the table of models VRT-M and VRT-AM use stainless steel. Their rails, rollers, roller cages and screws are also made of stainless steel. As a result, these guide systems have significantly high corrosion resistance.

The base and the table of model VRU-M are made of aluminum.

THK

B 8-3

## Rated Load and Nominal Life

### [Rated Loads in All Directions]

The rated loads of models VRT, VRT-A and VRU are equal in four directions (radial, reverse radial and lateral directions), and their values are expressed as C and C<sub>0</sub> in the corresponding specification tables.

### [Static Safety Factor f<sub>s</sub>]

The Cross-Roller Table may receive an unexpected external force while it is stationary or operative due to the generation of an inertia caused by vibrations and impact or start and stop. It is necessary to consider a static safety factor against such a working load.

$$f_s = \frac{C_0}{P_c} \quad \text{or} \quad f_s = \frac{M_0}{M}$$

- f<sub>s</sub> : Static safety factor  
 C<sub>0</sub> : Basic static load rating (kN)  
 M<sub>0</sub> : Static permissible moment (M<sub>A</sub>, M<sub>B</sub> and M<sub>C</sub>)  
 P<sub>c</sub> : Calculated load (kN)  
 M : Calculated moment (kN)

### ● Reference value of static safety factor

The static safety factors indicated in Table1 are the lower limits of reference values in the respective conditions.

Table1 Reference Values of Static Safety Factor (f<sub>s</sub>)

Machine using the LM system	Load conditions	Lower limit of f <sub>s</sub>
General industrial machinery	Without vibration or impact	1 to 1.3
	With vibration or impact	2 to 3

**[Calculating the Nominal Life]**

The nominal life of the THK cross-roller table is defined as 100 km. The nominal life ( $L_{10}$ ) is calculated from the basic dynamic load rating ( $C$ ) and the load acting on the cross-roller table ( $P_c$ ) using the following formula.

$$L_{10} = \left( \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots\dots(1)$$

$L_{10}$	: Nominal life	(km)
$C$	: Basic dynamic load rating	(kN)
$P_c$	: Calculated radial load	(kN)

When comparing the nominal life ( $L_{10}$ ), you must take into account whether the basic dynamic load rating was defined based on 50 km or 100 km. Convert the basic dynamic load rating based on ISO 14728-1 as necessary.

ISO-regulated basic dynamic load rating conversion formula:

$$C_{100} = \frac{C_{50}}{1.23}$$

$C_{50}$	: Basic dynamic load rating based on a nominal life of 50 km
$C_{100}$	: Basic dynamic load rating based on a nominal life of 100 km

**[Calculating the Modified Nominal Life]**

During use, a cross-roller table may be subjected to vibrations and shocks as well as fluctuating loads, which are difficult to detect. In addition, the operating temperature will have a decisive impact on the service life. Taking these factors into account, the modified nominal life ( $L_{10m}$ ) can be calculated according to the following formula (2).

● Modified factor  $\alpha$

$$\alpha = \frac{f_r}{f_w}$$

$\alpha$	: Modified factor	
$f_r$	: Temperature factor	(see Fig.1 on <a href="#">B8-6</a> )
$f_w$	: Load factor	(see Table 2 on <a href="#">B8-6</a> )

● Modified nominal life  $L_{10m}$

$$L_{10m} = \left( \alpha \times \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100 \quad \dots\dots\dots(2)$$

$L_{10m}$	: Modified nominal life	(km)
$C$	: Basic dynamic load rating	(kN)
$P_c$	: Calculated radial load	(kN)

**[Calculating the Service Life Time]**

When the nominal life ( $L_{10}$ ) has been obtained, if the stroke length and the number of reciprocations per minute are constant, the service life time is obtained using the following formula.

$$L_h = \frac{L_{10} \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

$L_h$	: Service life time	(h)
$\ell_s$	: Stroke length	(mm)
$n_1$	: Number of reciprocations per minute	(min <sup>-1</sup> )

### ● $f_t$ : Temperature Factor

If the temperature of the environment surrounding the operating model VRT, VRT-A or VRU exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.1.

Note) If the environment temperature exceeds 100°C, contact THK.

Fig.1 Temperature Factor ( $f_t$ )

### ● $f_w$ : Load Factor

In general, reciprocating machines tend to experience vibrations or impacts during operation, and it is difficult to accurately determine the vibrations generated during high-speed operation and impacts during frequent starts and stops. Therefore, when the actual load applied to a Model VRT, VRT-A, or VRU cannot be obtained, or when speed and vibrations have a significant influence, divide the basic dynamic load rating (C) by the corresponding load factor in Table 2, which has been empirically obtained.

Table 2 Load Factor ( $f_w$ )

Vibrations/ impact	Speed (V)	$f_w$
Faint	Very low $V \leq 0.25\text{m/s}$	1 to 1.2
Weak	Slow $0.25 < V \leq 1\text{m/s}$	1.2 to 1.5

## Precautions on Use

## Cross-Roller Table

### [Handling]

- (1) Do not disassemble the parts. This will result in loss of functionality.
- (2) The cross-roller table is shipped with the clearance adjustment screws set to the optimal preload level. Do not overtighten or overloosen this screw, as excess preload or clearance can affect the function of the product.
- (3) Take care not to drop or strike the Cross-Roller Table. Doing so may cause injury or damage. Giving an impact to it could also cause damage to its function even if the product looks intact.
- (4) When handling the product, wear protective gloves, safety shoes, etc., as necessary to ensure safety.

### [Precautions on Use]

- (1) Prevent foreign material, such as cutting chips or coolant, from entering the product. Failure to do so may cause damage.
- (2) If foreign material such as cutting chips adheres to the product, replenish the lubricant after cleaning the product.
- (3) Do not use the product at temperature of 100°C or higher.
- (4) Do not use the internal stopper, a mechanism that prevents the table from being removed, as a stopper. This may damage the stopper due to impact.
- (5) Micro-strokes tend to obstruct oil film to form on the raceway in contact with the rolling element, and may lead to fretting corrosion. Take consideration using grease offering excellent fretting prevention. THK also recommends periodically executing a full stroke with the unit to ensure that the raceway and balls are coated with lubricant.
- (6) Do not use undue force when fitting parts (pin, key, etc.) to the product. This may generate permanent deformation on the raceway, leading to loss of functionality.
- (7) Insufficient rigidity or accuracy of mounting members causes the bearing load to concentrate on one point and the bearing performance will drop significantly. Accordingly, give sufficient consideration to the rigidity/accuracy of the housing and base and strength of the fixing bolts.

### [Lubrication]

- (1) For lubrication of the Cross-Roller Table, use lithium-soap group grease or oil when it is necessary as with ordinary bearings.
- (2) Thoroughly wipe off anti-rust oil and feed lubricant before using the product.
- (3) When lubricating the product, apply grease directly on the raceway and stroke the product several times to let the grease spread inside.
- (4) Do not mix different lubricants. Mixing greases using the same type of thickening agent may still cause adverse interaction between the two greases if they use different additives, etc.
- (5) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, use the grease appropriate for the specification/environment.
- (6) The consistency of grease changes according to the temperature. Take note that the slide resistance of the Cross-Roller Table also changes as the consistency of grease changes.
- (7) After lubrication, the slide resistance of the Cross-Roller Table may increase due to the agitation resistance of grease. Be sure to perform a break-in to let the grease spread fully, before operating the machine.
- (8) Excess grease may scatter immediately after lubrication, so wipe off scattered grease as necessary.

## Precautions on Use

- (9) The properties of grease deteriorate and its lubrication performance drops over time, so grease must be checked and added properly according to the use frequency of the machine.
- (10) The greasing interval varies depending on the use condition and service environment. Set the final lubrication interval/amount based on the actual machine.

### [Displacement of Cage]

The movements of the cage that holds the rollers are highly precise, but the cage can be displaced due to drive vibration, inertial force, or impact.

Please consult THK before using this product under any of the following conditions.

- In a vertical position
- With a pneumatic cylinder drive
- With a cam drive
- With a high-speed crank drive
- With a heavy moment load
- In a configuration where the external stopper butts up against the table

### [Storage]

When storing the Cross-Roller Table, enclose it in a package designated by THK and store it in a room in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

### [Disposal]

Dispose of the product properly as industrial waste.
